Cambridge Manlift Certification

Cambridge Manlift Certification - The Elevated Platforms and Manlifts Certification program helps to provide the necessary training on the safe operating procedures, work practice, regulations and rules regarding the everyday activities for the operators of this machine. The course has been designed for individuals who are actively involved in these activities or individuals who have a basic knowledge of this equipment.

manlifts and aerial platforms have become common and integral machinery in industrial settings during the past few decades. These machinery provide an easy way to lift staff near what should be carried out on a stable platform apparatus, allowing staff to perform tasks with greater comfort and safety rather than being perched on top of ladders or scaffoldings.

The manlift is similar to other industrial tools in that they are safe if utilized properly. Since they lift employees above floor or ground level, accidents can easily occur and this might cause serious death or injuries for both the manlift operators as well as any passerby who may not be lucky enough to be standing underneath.

Manlifts come in different models. The majority fit into 1 or 2 categories: the scissor lift, which is capable of moving up and down and the articulating boom lift, which can move both vertically and horizontally.

Protecting Staff

Correct training is essential in regard to safety matters. A lot of the businesses that lease manlifts will provide training at the jobsite. Each and every worker who would be working on the machine or operating it should receive training in safe operations. It is also essential that just those workers who have received training must be authorized to operate the controls. Operating procedures and communication rules must be clear. Hence, staff on the ground should not operate controls without the approval and knowledge of any employees in the basket.

Those staff who will be occupying the basket are required to wear proper fall protection such as a harness and lanyard. That protection should be connected to the manlift itself and not to a surface nearby. The worker must ensure that she or he has made any adjustments required to reflect the change in fall distance if the height of the work area changes.

Manlifts must be tested and inspected every day to make certain they are in safe operating condition. Prior to utilizing the machine, whatever defects must be re-checked and repaired.
